

Merja Weekly Updates

Week 1: 6/8-6/12

Monday

- What happens on CL side?
- What is Spec2Saw?

Tuesday

- TPF training/CL process flow
- Intro to divisional forum
- Intro to UAT OPS testing

Wednesday

- What happens on HPL side?
- HPL training
- What do machine problems look like?
- TPF and Maintenance meeting
- UAT OPS testing

Thursday

- Day in the life of QA
- Gannomat issue
- Work on TV stand for James
- First MRB meeting
- Anderson program creation crash course
- Spend time w/ second shift

Friday

- Help solve issues w/ HPL edge bander and look at issues w edge trimmer

Tasks

- Help James assemble monitors for Anderson
Assigned: Wed. 4 PM
Due: TV needs to be done by Thurs. 6/18, monitor TBD
Progress:
Wed-started on monitor
Thurs-started on TV
Fri-
- Collect data from PM for troubleshooting machines
Assigned: Thurs. AM
Due: TBD
Progress:
Thurs-couldn't get access
Fri-
- Figure out how to hang whiteboard in QA
Assigned: Wed?
Due: TBD
Progress:
Wed-talked to QA and maintenance- screwing into studs won't work, need brackets for the top that go around the back side of whiteboard
Thurs-N/A
Fri-

Week 2: 6/15-6/17

Tasks

- ~~Assemble TV+TV stand~~ and monitor+arm for the Anderson
Assigned: Wed. 6/10 4 PM
Due: TV needs to be done by Thurs. 6/18, monitor by Fri. 6/19
Progress:
 - Wed 6/10-started to assemble the monitor arm but then realized it was the wrong one
 - Thurs 6/ 11-started assembling TV stand
 - Fri 6/12- Assembled TV stand with the TV on it and tested the wireless HDMI
 - Mon 6/15- James checked the TV and said everything looks good- TV DONE
 - Tues 6/16- Assembled monitor arm, still need to attach actual monitor still
- Collect data from PM for troubleshooting machines
Assigned: Thurs. AM
Due: TBD
Progress:
 - Mon 6/15- Got access
 - Tues 6/16- Started compiling data from PM into an excel sheet (Rainbow- got through about 10 issues). James suggested using cursor to automate the process- now waiting on cursor pro to be approved
 - Wed 6/17- started working on what I need to upload and tell cursor if I get access
- Figure out how to hang whiteboard in QA
Assigned: Wed?
Progress:
 - Wed 6/10-talked to QA and maintenance- screwing into studs won't work (too heavy and Gabriel doesn't want to risk the board falling out of the wall), need brackets for the top that go around the back side of whiteboard
 - Mon 6/15- proposed mirror clips for the whiteboard to Michael and clips were ordered
 - Wed 6/17- mirror clips came in but accidentally ordered wrong size
- Figure out a solution for putting in inserts at Evolve station
Assigned: Mon 6/15
Due: TBD
Progress:
 - Tues 6/16- looked at air presses but most of them seem too small for this application. Researched handheld pneumatic insertion tools- could be a good option. Next step is to go look at the inserts so I can dial in on which specific product.
- UAT testing
 - Monday 6/15- Finished scenario 14, finished scenario 2
 - Tues 6/16- tested scenario 2 again

Week 3: 6/17-6/24

Tasks

~~Assemble TV+TV stand and monitor+arm for the Anderson~~

Assigned: Wed. 6/10 4 PM

Due: TV needs to be done by Thurs. 6/18, monitor by Fri. 6/19

Progress:

Wed 6/17- Attached monitor to monitor arm. FINISHED

• Collect data from PM for troubleshooting machines

Progress:

Wed 6/17- started working on what I need to upload and tell cursor if I get access. Continued with manual logging.

Thurs 6/18- continued manual logging. James gave me access to his Devin account in order to start the automation process. By the end of the day the program was able to go through all of the PM data on its own and put it into a user interface. This was done by uploading the HTML code from the PM website and having Devin create a web scraper and a python UI.

Fri 6/19- implemented AI (Gemini) to the program using an API key. Put the program into a server so that others could easily access. The program can now make checklists for operators based on the machine to troubleshoot problems. Checklists aren't perfect and need to be edited and then looked at by leads and maintenance. Gave Devin an example checklist and made a UI to view all the checklists for each machine. Made the checklist available to edit.

Mon 6/22- Presented to eric/got feedback. Checked editing properties by scraping the rainbow again and it seems to work but not sure if that because there weren't any new problems, made some small aesthetic changes, and looked into weekly refreshes but think I'll need James' help. Got another API key to finish generating checklists.

Tues 6/23- Presented to Sean and got feedback/what he wants on the UI. Fixed issues with attachments (they can now be accessed from the UI). Added scheduled work orders to the UI (updated the scraper to do so). Planned out what the UI will look like with dashboards.

Wed 6/23- Finished scraping but there are lots of issues. Trying to debug.

• Figure out how to hang whiteboard in QA

Progress:

Wed 6/17- mirror clips came in but accidentally ordered wrong size. Sent Michael the new ones to order

Wed 6/24- new mirror clips were delivered. Checked and mirror clips fit. Scheduled a work order for installation.

• Figure out a solution for putting in inserts at Evolve station

Assigned: Mon 6/15

Progress:

Wed 6/17- grabbed inserts to look at. Talked to Pedro about what he wanted/needed at the evolve station for this. Did a lot of research and proposed an arbor press. Need to work out details.

Thurs 6/18- did measurements and looked at evolve station current setup. Tried to think of a solution of where an arbor press could be placed but might need to go back to the handheld pneumatic insertion tool idea.

Mon 6/22- researched linear torque reaction arms kind of like the one used for inserts after the gannomat but still can't find the right thing I'm looking for

• UAT testing

Mon 6/22- tested scenario 7

Tues 6/23- tested scenario 2 and had a meeting with James going in depth on Anderson cutting and what I need to know

Other stuff

- Talked to Jeff about baby proofing on tenoner (Wed)
- Discussed the delamination issue with Sean and Juan and brainstormed ideas (Thurs)
- Jeff brought a problem label (dot instead of comma, gannomat wont scan) to my attention and I passed it along to OT

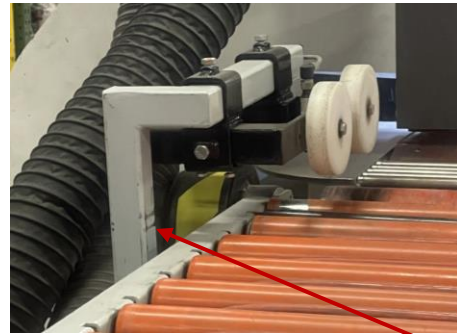

Tenoner Baby Proofing

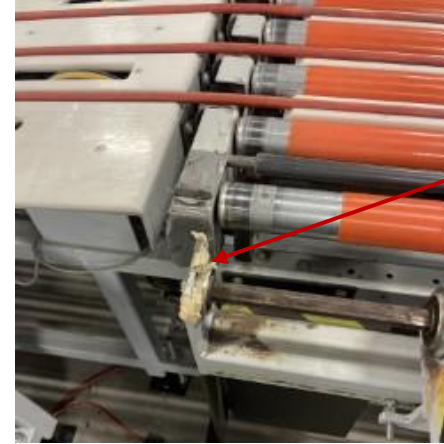

Corners need some type of covering to avoid chipping

Padding on end of table is worn out and causing chipping. Highest priority

Scraping pieces, maybe need a pipe cover or something

Needs covering, can't use padding

Duct tape keeps coming off

Week 4: 6/24-7/1

TASKS

- Collect data from PM for troubleshooting machines

Progress:

Wed 6/24- Finished scraping but there are lots of issues. Trying to debug. Ruined the web scraper, started over. Scraped everything from all departments.

Thurs 6/25- Made a new server and UI, this time including soap and assembly as well. Made dashboards (entire division, per department, per machine). Sorted machines from equipment/tools etc. In TPF. Added quick view of stats for each machine. Had a meeting with James about intermittent updates and how to do that and decided I needed access to the PM database.

Fri 6/26- There is no way to get access in the way that I need to PM so in order to do intermittent updates, scraping will just have to occur every night. Need James' help to put onto virtual machine to do this scraping but virtual machine is down right now. Talked to Gabriel about his ideas for this tool like his parts list he's making. I now need to add all the other departments like shipping.

Mon 6/29- Included the other 7 departments (assembly, general, maintenance, machine shop, shipping, quality assurance, mfg eng). The scraper didn't scrape data from depts. with no unscheduled work orders so I had to fix that/rescrape a few. The UI also didn't include/missed some data from TPF and S&A, not sure why bc data was stored just not displayed. All of these problems are fixed.

Tues 6/30- virtual machine is still broken. Need this for scheduled updates to run every night. Learned that I can still start upcoming/ past week dashboards (didn't know if I needed to wait for the virtual machine to do this but discussed with James)

- Figure out how to hang whiteboard in QA

Progress:

Thurs 6/25- Gabriel picked up hardware and will be installing (hopefully) next week

Wed 7/1- followed up; whiteboard still not up, Gabriel trying to get to it either end of this week or next week

- Figure out a solution for putting in inserts at Evolve station

Assigned: Mon 6/15

Progress:

Fri 6/26- talked to Gabriel and am now researching air hammers, toggle presses, air cylinders, lots of ideas. Did a lot of looking into pneumatic toggle presses. I think this could be the solution. Need to find a specific one though and do measurements.

Mon 6/29- suggested pneumatic toggle press to Eric- need to hone in on details

Wed 7/1- need to find something to hold the insert in place, went downstairs and confirmed something needs to be guiding the insert. Chatted with Gabriel about ideas- put insert into toggle clamp? Create a shorter insert holder?

- UAT testing

Mon 6/29- scenario 11 and scenario 16

Other stuff

- Zane showed me how UAAV testing is done
- Gave test scenarios to CS for error labels I brought to OT's attention last week; responded to email with test scenarios and tested labels at gannomat
- Ran CL process training / tour
- Learned about 3 pillars and started brainstorming "process consistency" in the event of a new operator
- Shared all of my scraped data with Spoorthy to advance her project quicker

Week 5: 7/1-7/8

TASKS

- Collect data from PM for troubleshooting machines

Progress:

Wed 7/1- presented to Sean, Jiego, Elaine, Matt

Mon 7/6- prepared the server to be transferred to the virtual machine and scrape everything every night. Archives of past checklists will be saved every night so that we don't accidentally lose edits. Also allowed the server to be shareable. Added weekly dashboards (last week, this week, next week)

Tues 7/7- server was uploaded to the virtual machine and is now shareable. Made some edits regarding the format and aesthetic of the weekly dashboards.

Wed 7/8- found some discrepancies in data due to scraping improperly or maybe overnight update not working correctly. Trying to diagnose the issue. Switched to headless scraping but still having issues

- Figure out how to hang whiteboard in QA

Progress:

Wed 7/1- followed up; whiteboard still not up, Gabriel trying to get to it either end of this week or next week

- Figure out a solution for putting in inserts at Evolve station

Assigned: Mon 6/15

Progress:

Wed 7/1- need to find something to hold the insert in place, went downstairs and confirmed something needs to be guiding the insert. Chatted with Gabriel about ideas- put insert into toggle clamp? Create a shorter insert holder?

- UAT testing

Wed 7/1- Scenario 2

- HPL process flow PowerPoint

Thurs 7/2- made a process flow chart and clarified HPL questions downstairs. Started making slideshow and organized structure of the presentation

Mon 7/6- added pictures and speaker notes. Fixed steel core stile cell flow on flow chart after clarifying downstairs

Tues 7/7- added hardware route. Presented and figured out small things that need to be added like a picture of the laminate getting put on after the glue spreader as well as information about what small hardware is sometimes put on.

Wed 7/8- added info regarding small hardware and pictures regarding laminate application

Other stuff

- HPL tour (Zane, Spoorthy, James)
- CL process training and tour (Brendan)
- Brainstorming for 3 pillars-wed
- HPL training (zane, spoorthy, james)
- More 3 pillars brainstorming-tues
- HPL training and tour (Brendan)
- Glue gun cleaning issue was brought to my attention. Need to work on finding a solution
- Ganno label testing

Week 6: 7/8-7/15

TASKS

- **MINT**
 - Wed 7/8- found some discrepancies in data due to scraper failing on certain departments (too many instances running at once, as soon as the scraper couldn't find something in one department work order it would fail). Switched to headless scraping (no UI required for headless, grabs HTML from website) but still need to refine this tomorrow.
 - Thurs 7/9- finished setting up headless scraping. Discrepancies seem to be solved and there are rollback features now (if for some reason the scraper fails it goes back to the previous version). Had a meeting with Gabriel and James about the spare parts smart sheet and how he wants to be able to use it in relation to the PM tool (James made a mock up of what the spare parts tool could look like, basically decided to switch from smartsheet to a tool that James and I make). Got Devin Pro yay. Added "filters" (unscheduled, scheduled, all) to the weekly dashboards. Set up a password that people have to put in before they can edit the checklist. Made checklist editing more user friendly/easier to look at.
 - Fri 7/10- scraper failed overnight. James will need to investigate the VM, not much I can do on my end right now for this. Compiled list of TPF machines (in order they appear on MINT) so that I can start making the checklist for editing the checklists.
 - Mon 7/13- James added spare parts tab and a tutorial. Made the spreadsheet for editing (tracking what checklists have been edited and by who) and scheduled a meeting to explain editing to mfg and maint and start editing the first machine.
 - Tues 7/14- hacked...
- **Figure out how to hang whiteboard in QA**
 - Fri 7/10- checked in and Gabriel says he's going to put it up on Saturday.
 - Mon 7/13- whiteboard is up. Gabriel did not end up using hardware I provided.
- **Figure out a solution for putting in inserts at Evolve station**
 - Fri 7/10- did more research but space just seems to be the biggest issue. Will need to keep researching.
- **UAT testing**
 - Mon 7/13- most of scenario 2, 5, and 7. Waiting for James to get calculator running again.

Other stuff

- Trying to find a name for PM tool!
- Looked at chipping issue on the edgebander. Determined to be a problem for maintenance
- Still need to look into glue gun issue (getting clogged, currently put it in water)

Week 7: 7/15-7/22

TASKS

MINT

Wed 7/15-

- chatted with Kieun about MINT-got ideas/feedback (suggested making a visual aid for trends)
- Made a game plan with Eric for trends tab, what still needs to be fixed/done (updating at night, checklist editing, how often will edits be saved?)
- Talked to Sean about what PM currently does and is used for
- Made the trends tab for the Holzma that gives a plot of what things look like month to month each year
- Prompted AI to create a summary for each month

Thurs 7/16-

- Expanded trends to "important" TPF machines
- Worked with James to make a version control system so that any change made is saved as a "version, used SQLite to store all of these versions but you can also see them directly on MINT, refined the checklist regeneration and prompt (just adds to the latest version)
- Made a "copy" of MINT to start adding a mockup PM to

Fri 7/17-

- Created a "company" page so that other divisions could be added
- Added the ability to create a new scheduled or unscheduled work order
- Started adding some password protection

Mon 7/20-

- Added password for version history
- Refined the process of adding an unscheduled work order -add a new work order, then labor time, material cost, downtime, material cost are required fields once WO is marked closed and complete. Unscheduled are automatically "pending"
- Refined scheduled work order process- mostly same refinements as unscheduled but added a rate of occurrence (next instance will autopopulate but also added the ability to delete one occurrence or stop the occurrence)
- Added ability to export any work order to a PDF
- Worked with James to create the ability for notifications to be sent (any time a work order is created or closed and a weekly email that shows what scheduled work orders are coming up or past due) did this by making a gmail account and getting an "app password" basically something that allows Devin to control this email account. What will need to be done in the future is getting an outlook email and app password from IT

Tues 7/21-

- Created a "inactive folder" things can be deleted from MINT but just go into an inactive folder where they can be restored (example: delete a machine and it will delete all of the stats along with it)
- Met with Michael to start organizing S&A equipment into categories on MINT
- Created a trends tab for all of the other "machines" in TPF as well as an overall trends tab for all of the TPF machines together
- Presented to OT team (go feedback, suggestions, things to work on, and things to cross reference like machine life excel sheet)

Other stuff

- Still need to look into glue gun issue (getting clogged, currently put it in water)
- Figure out a solution for putting in inserts at Evolve station- didn't do this week
- UAT testing- didn't do this week
- Tiny bit of 3 pillars brainstorming on Tues 7/21

Week 8: 7/22-7/29

TASKS

MINT

Wed 7/22-

- Made logo and changed website colors
- Made "actualized" work order filters in the trends tab
- Created filters for searching through work orders
- Started going through the PM 2.0 excel sheet suggestions to decide what to implement
- Added ability to export a pdf of weekly schedule

Thurs 7/23-

- Continued going through PM 2.0 excel sheet suggestions
- Fixed some passwords on the frontend of mint
- Edited the view of the checklist (bolded some stuff, added bullet points, trying to make it more readable)
- Added a calendar view
- Organized the machine longevity excel file just for TPF machines

Fri 7/24-

- Added ability to export monthly calendar
- Added a dropdown for events added to calendar (user can only choose from tech visit, safety event, or vendor visit)
- Added a prod stop color coding (if a machine has a pending work order of urgency 1 it's highlighted in red)
- Scraped PM for machine info
- Added the machine longevity for TPF machines and went over discrepancies with Sean (some machines not on PM but on excel sheet)
- Showed Sean updated MINT and got some feedback
- Integrated machine longevity excel sheet data into a new tab "machine info"

Other stuff

- Still need to look into glue gun issue (getting clogged, currently put it in water)
- Figure out a solution for putting in inserts at Evolve station- didn't do this week
- UAT testing- didn't do this week
- 3 pillars- did not do

Week 8: 7/22-7/29 (continued)

TASKS

MINT

Mon 7/27-

- Machine info tab now has machine longevity info and machine info from PM (this includes some contacts)- sorted this data using AI and formatted it to be more user friendly (card like contacts, purchase info, settings, etc) and locked editing capabilities
- Added Sean's contact list to MINT (overall contact list on the division page including seans list+scraped contacts from PM) (contact list for each machine from PM data and seans list if applicable)
- Made contact list editable and added filters based on type of contact (can also add a new type which will follow with a filter as well)
- MINT went down in the morning for about an hour. When I tried sorting using code instead of AI, the format of the phone numbers for the contacts tripped up the server, not completely sure why (will need to ask James when he gets back from BMC)

Tues 7/28-

- Added pareto charts to all of the things that have trend charts already (TPF department, per TPF machine)
- Added the ability to add a vertical line to the trends chart to show any major events that have happened
- Scraped "vendors" from PM (more contacts)
- Started adding abilities to attach names to work orders, each maintenance personnel and Sean have their own user profile- still lots of refining to do though

Other stuff

- Still need to look into glue gun issue (getting clogged, currently put it in water)
- Figure out a solution for putting in inserts at Evolve station- didn't do this week
- UAT testing- didn't do this week
- 3 pillars- did not do
